Name: $\qquad$

## Factored Form of Quadratic Functions

Only use your calculator to check your answers.
In an equation like $y=2(x+3)(x-4)$, one can quickly find the intercepts and the vertex.

1. What is the value of $x$ at the $y$-intercept? Substitute this value for $x$ in the equation, and find the $y$-intercept.
2. What is the value of $y$ at the $x$-intercepts? Substitute this value for $y$ in the equation, and find the $x$-intercepts with the help of the Zero Product Property.
3. If you know the $x$-intercepts, how can you find the $x$-coordinate of the vertex? Find it.
4. If you know the x-coordinate of the vertex, how can you find its y-coordinate? Find it.
5. Find the intercepts and vertex for:
a. $y=.5(x-.4)(x-1)$
b. $\quad y=2(x+3)(x+4)$
6. Explain in words and symbols how you would find the intercepts and vertex for a function of the form:

$$
y=a(x-p)(x-q)
$$

7. Find the equation and the vertex for a parabola with intercepts:
a. $(3,0),(6,0),(0,36)$
b. $(3,0),(6,0),(0,9)$
c. $(-3,0),(-6,0),(0,-9)$
d. $(-3,0),(6,0),(0,6)$
8. The vertex and one of the two $x$-intercepts of parabolas are given. Find the equation and the y -intercept.
a. vertex: $(2,-2)$. $x$-intercept: $(1,0)$
b. vertex: $(1,-12)$. $x$-intercept: $(-1,0)$
c. vertex: $(3,4.5)$. $x$-intercept: $(6,0)$
